

How Marijuana Hacks Reward System

So, somebody tell me, what is THC? Okay, where's the found in? Marijuana, so if you look at those two molecules, the one on the right is THC. The one on the left is actually a neurochemical that your brain normally produces Anandamide. Basically, what it does is, it affects things like pain, appetite, memory, your mood. So, think with me for just a moment if there is a receptor that is specifically built three-dimensionally to accept that guy right there, but you're filling it with that. Anybody think that maybe that would alter things? So, if this is supposed to fit in it, but this fits in it, then all of a sudden, your brain is being sent a message that it shouldn't be getting.
